

RALNCS 1.0 — quick guide

SketchUp 2024 extension: RAL Classic and NCS 1950 color fan, nearest RAL/NCS for every model material, one-click color spec

1 Install

SketchUp → **Window** → **Extension Manager** → **Install Extension** → pick RALNCS-1.0-eng.rbz → restart SketchUp. You get the “RALNCS” toolbar (two buttons) and the **Extensions** → **RALNCS** menu.

2 RAL / NCS fan

“Fan” toolbar button or **Extensions** → **RALNCS** → **RAL / NCS fan**.

1. Tab (216 colors) or (1950 colors). Search by code or name: *3020, traffic, 0580-Y80R*.
2. Click a color — a large swatch, code, HEX and RGB appear on the right.
3. — a material named *RAL 3020 Traffic red* is added to the model.
 — same, plus the Paint Bucket tool is activated.

On-screen colors are sRGB approximations. Monitors differ: verify the final choice against a physical fan deck.

3 Material audit (spec)

“Audit” toolbar button or **Extensions** → **RALNCS** → **Material audit (spec)**. The plugin takes **all** model materials (textured ones use the averaged texture color and are tagged “texture”) and finds the nearest RAL and NCS for each.

The **ΔE** column shows how far the match is from the original color: <1 excellent <2 good <5 noticeable ≥5 outside the palette.

- — show/hide and reorder columns; the RAL and NCS groups can be hidden or swapped as a whole. The setup is remembered.
- — exactly the columns on screen go to the clipboard. In Google Sheets / Excel press : the “Color” columns paste with real cell fills, RGB comes in spec format (240-211-208).
- / — recolor the checked materials to the exact palette color. Undo with .
- **tint textured** — off by default: textures are left untouched. Turn it on to have SketchUp tint the texture to the palette color.

Known limitation. With Enscape 4.1 loaded, undoing () a texture tint may close SketchUp — this is an Enscape bug. Save the model before bulk tinting; updating Enscape helps.
